

Fluid Reactor

Stop the damage bore water causes!

Get better use of the mineral base in your water supply.

The new Australian **Fluid Reactor** is the natural way to create soft water behaviour and control the damage salinity causes.

Performance Guarantee

Leaf burn stopped

Magnetically treated water reduces and can completely stop leaf burn on plants. The calcium hardness bonds the chlorides and sodium to the leaf and the heat from the sun causes burning which destroys the leaf. Plants, like humans, do not like being burnt. Magnetic conditioning stops the calcium from crystallising or behaving as glue, holding the salt to the leaf structure.

Water Savings

Real water savings can be effected with the The Reactor. When water is held in a strong magnetically locked grid, there is no further molecular movement. Water then has lost its surface tension. It soaks better, and offers better plant capillary draw action, less run-off, less loss. Don't drown plants or waste precious water. Save both.

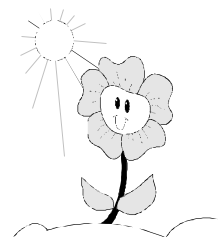

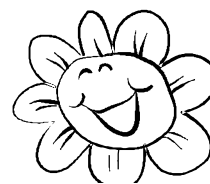

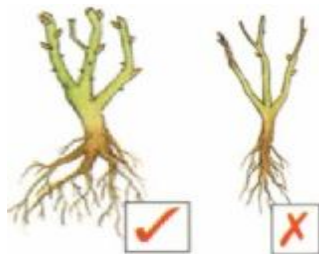

Root Damage

The calcium is prevented from crystallising by being kept in solution. This also stops the development of salt build-up in the soil at root level.

It is the retained sodium levels in the upper crust of the soil that burn roots and cause them to degenerate. It is the job of the **Reactor** to stop and reverse this.

Mineral benefit

The Reactor places the minerals into a much more soluble state and the plants draw from this what they need. The softened water penetrates the soil better and opens it up allowing more robust root growth for the plant root structure.

Salt build-up

The magnetically treated water will actually dissolve the salt build-up in the soil and allow it to drain away. Where to? Back to where it came from of course, as ground water.

Analysis - Installation

Analysis is required on all private supplies, and technician installation is necessary. We supply both to ensure that you get the results you seek.
